

1.1 Where is the water?

Activity 1: Global Water Distribution

A sector graph (also called a pie graph) shows how a whole is divided into parts. Each sector represents a percentage of the total. Sector graphs are useful for showing proportions, such as the different types of water on Earth.

Activity: Create a sector graph of the different types of water available in the world. Label each sector clearly.

Water type	% of total water
Saltwater (oceans)	97%
Freshwater (frozen in ice caps/glaciers)	2%
Freshwater (surface water in rivers/lakes)	0.3%
Freshwater (groundwater)	0.7%

1. Write two sentences describing the pattern you see (e.g. which type dominates...)

2. Finish the sentence.

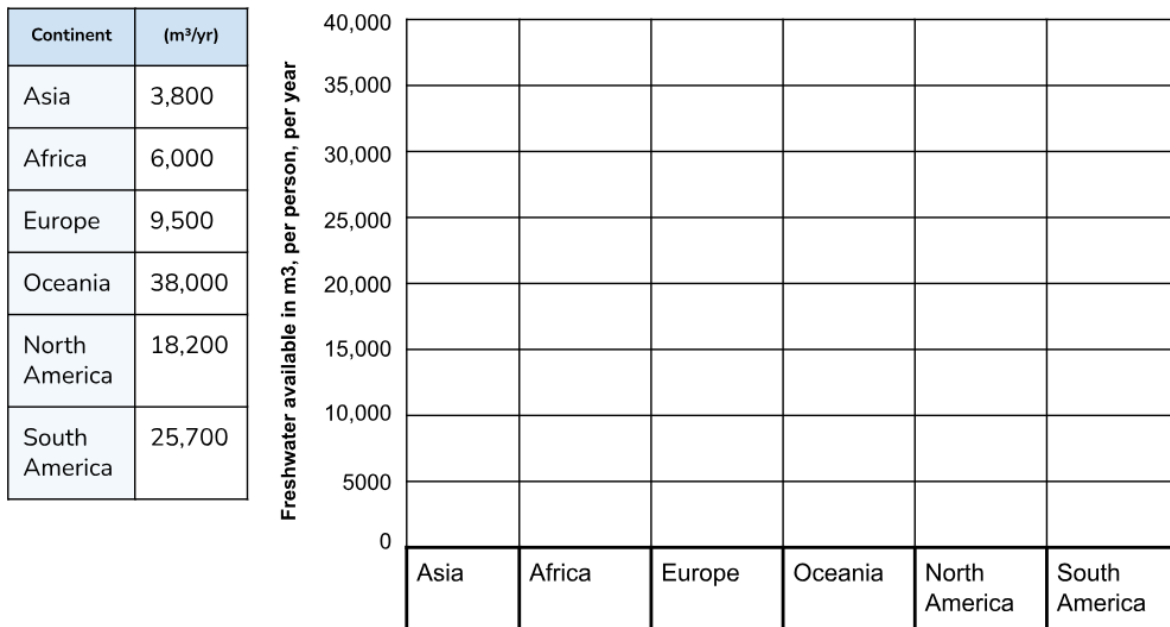

Because freshwater is such a small percentage of Earth's water, this might cause problems because...

Activity 2: Available freshwater by continent.

A column graph lets us compare amounts of something across different groups. For example, it helps us see how much freshwater is available per person on each continent.

Activity: Create a column graph using the data on the next page, and then answer the questions.

Approximate freshwater available per person in each continent

Questions:

- Which continent has the most freshwater per person?
- Which continent has the least?
- Describe one pattern you can see in the graph.
- Suggest one natural reason why freshwater varies between continents.
