

3.2 Constructing climate graphs

Construct two climate graphs using real-world data from two places with very different climates: Alice Springs (Northern Territory) and Cairns (North Queensland). The data for each location is provided below, with letters representing the months of the year. For each month, plot the precipitation as a bar, then plot a dot for the temperature. When all the dots are placed, join them to create a line graph.

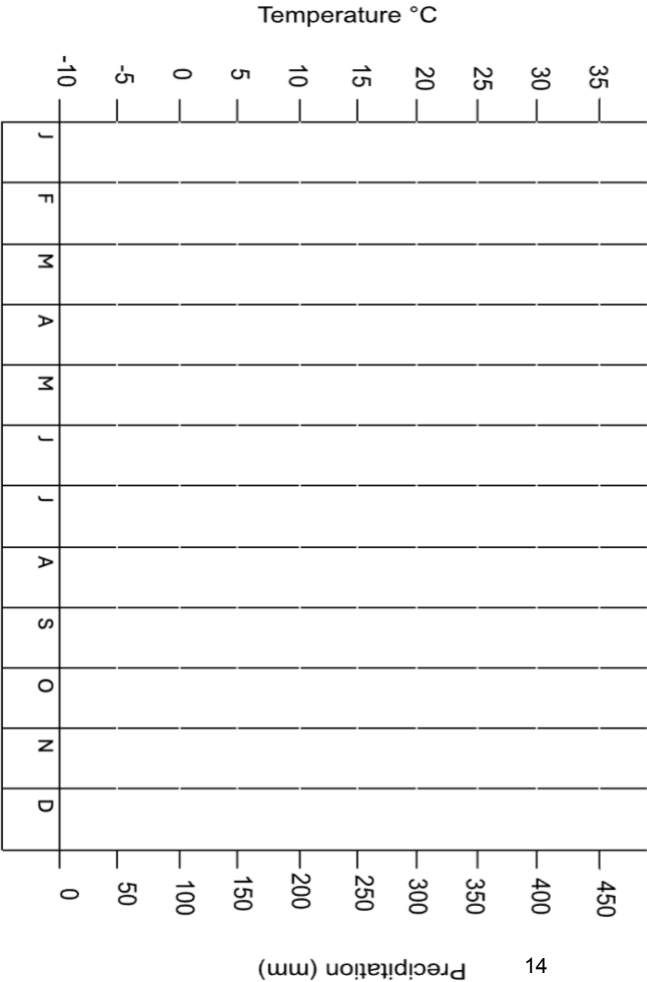

Cairns, North Queensland

Month	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
Temperature (°C)	28.0	28.0	27.0	25.0	23.0	21.5	21.0	22.0	23.5	25.0	27.0	28.0
Precipitation (mm)	395	455	420	200	110	60	35	25	30	45	95	175

Alice Springs, Northern Territory

Month	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
Temperature (°C)	29.0	28.0	25.0	20.0	15.0	12.0	12.5	15.0	20.0	24.0	27.0	29.0
Precipitation (mm)	40	38	33	19	16	11	12	11	16	22	29	40

Answer the following questions about each climate graph.

	Describe the rainfall and temperature pattern.	Identify the wettest, driest, hottest and coolest months for each.
Cairns		
Alice Springs		

Compare the two climates by answering the following questions.

1. How do rainfall patterns differ between the two places?

2. Which location is more likely to rely on surface water? Groundwater? Why?

3. How could climate influence the types of water issues each community faces?
