

7.3 Graphing water access

Graphs help us communicate geographical information clearly and identify patterns, trends, and anomalies. By graphing data, we can form ideas and judgements about issues such as global water access. The table below shows the percentage of people with access to improved water sources in different country groups.

Create a line graph below for each category, then answer the questions that follow.

Region	2000	2005	2010	2015	2020
High-income countries	98.2	99.0	99.2	99.4	99.4
Low-income countries	51.5	57.0	63.6	69.8	76.3
Lower-Middle-income countries	81.8	84.7	87.5	90.3	92.9
Upper-middle income countries	84	87.7	91.5	94.6	97.1
Sub-Saharan Africa	57.1	59.3	61.8	65.0	66.7
World	83.7	86.5	89.3	91.7	94.0

1. Conduct a PQE on your graph.

Quantify	
Exception	

2. Why do high-income countries always have good access to improved water?

3. Why might Sub-Saharan Africa and low-income countries show slower progress?

4. How does access to water relate to wellbeing and development?

5. Extension: Prediction questions

- a. Predict the value for **2025** for each region, and create a 'dotted line' between 2020 and 2025 for each line, to show your prediction.
- b. Explain your reasoning using evidence (e.g., linear growth, rate of change, slowing improvements).

- c. Discuss whether your prediction is realistic. What external factors might speed up or slow progress?
